James R. Fischer, Director
S.C. Agricultural Experiment Station

FOREWORD

It is with pleasure that the South Carolina Agricultural Statistics Service presents this 1988 edition of South Carolina Crop Statistics. The agricultural statistics in this publication include revised crop acres, yield, production and value statistics at the State and county level for 1986, and preliminary estimates for 1987. Also included are data on number of farms, land in farms, commercial fertilizer, fruit and vegetable statistics, and quarterly on and off farm grain stocks estimates.

This bulletin is a cooperative effort between the National Agricultural Statistics Service of the United States Department of Agriculture, and the Department of Agricultural Economics and Rural Sociology and South Carolina Agricultural Experiment Station of Clemson University. This cooperative relationship increases efficiency by avoiding duplication of effort and conflicting reports. The Federal program serves to provide comparable statistics for all states, which are released in national reports, while State funds make it possible to prepare and publish more detailed statistics for South Carolina such as those presented in this bulletin.

We are indebted to thousands of South Carolina farmers who voluntarily give their time and effort to report various information relating to their farming operation. Without this voluntary cooperation, it would be impossible to make reliable estimates or compile this publication. Thanks to all of you who assisted in this effort. In addition to the voluntary reporters, I want to publicly thank my staff for their dedication in preparing this bulletin.

Sincerely,

Henry J. Power, Jr.

Henry J. Power, Jr.
State Statistician

The South Carolina Agricultural Experiment Station is a cooperative program financed from Federal and State funds. It is the policy of the Experiment Station to comply with the regulations of Title VI, the Civil Rights Act of 1964. Complaints may be filed with the Director, S.C. Agricultural Experiment Station, Clemson University, Clemson, S.C. 29631.

SOUTH CAROLINA CROP SUMMARY

1987

JANUARY: Although the weather had its ups and downs, temperatures averaged below normal during January. The coldest weather occurred in Western South Carolina where readings were about 3 degrees below normal. Rainfall during January was considerably above normal with some Southern stations experiencing their wettest January of record.

During the first part of the month, farmers wrapped up harvesting of the 1986 cotton and soybean crops. Other activities included pruning fruit trees, preparation of tobacco seed beds, late small grain planting, repairing equipment and general farm maintenance.

FEBRUARY: Temperatures during the shortest month of the year averaged 1 to 2 degrees above normal in Upstate South Carolina while Coastal temperatures averaged slightly below normal. The month was wetter than normal and late month rains washed away any lingering doubts about the 1986 drought's end. Total precipitation ranged from 2.43" at McColl to 8.76" at Oakway.

Early in the month, fruit tree pruning was ending; tobacco bed preparation and planting continued and top dressing was being applied to small grain crops. Late in the month, farmers began preparing crop land for spring planting and continued general farm and equipment maintenance.

MARCH: Although March came in like a lamb with temperatures ten or more degrees above normal, it went out as a lion with cold, windy weather and temperatures averaging more than ten degrees below normal. Monthly temperatures averaged in the mid 50's in Southern South Carolina and in the upper 40's across the Upstate. Precipitation was generally above normal except slightly below in portions of the Mountains and Piedmont. Heavy rainfall in late February and early March produced the worst flooding in the last ten years along portions of the Santee, Pee Dee and Lynches Rivers.

Top dressing of small grains continued early in the month. Planting of watermelons, cantaloups, cucumbers and tomatoes also began. Wet soils slowed land preparation for row crops at mid-month.

By the end of the month, peaches were in full bloom and in good condition. Corn planting was underway, but considerably behind 1986, as was watermelon and cantaloup planting. Tomato planting however, was well ahead of 1986. All planting activities were slowed by heavy rains the last week of the month.

APRIL: Temperatures during the first eight days of April averaged more than nine degrees below normal. Throughout the remainder of the month, temperatures were frequently at or above normal. On the 30th, many stations reported high temperatures in the 90's. Rainfall was considerably less than normal, except at a few locations. Columbia only had 0.40" - the second driest April on record.

The month began wet and cold with some scattered light freeze damage to peaches. Planting activities were all slowed by the poor weather. Varying weather conditions throughout the month alternately aided and slowed planting activities so that by the end of the month, planting was behind by varying degrees for almost all crops. Corn was in good condition with planting at about the normal level; tobacco was fair to good with planting 23 percent behind normal; and cotton was fair to good and 16 percent behind normal. Peanut planting was underway, small grains were looking good but heading later than normal, and other crops were generally in good condition.

MAY: The weather during May was hotter and drier than usual. Daily temperatures after the 11th were higher than normal with maximum readings mostly in the upper 80's to occasionally in the 90's. Rainfall was mostly one to three inches below normal. The greatest monthly total was 5.39" recorded at Aiken and Summerville while Ft. Mill had only 0.22" and Winnsboro's total rainfall was only 0.35".

Planting of all crops increased during the early part of the month and by mid-month corn and tobacco planting was virtually complete. The condition of both crops was good at the beginning of the month, but dry weather during the month lowered conditions to fair to good by month's end. Cotton planting moved well during the month and was almost complete by the end of the month. Soybean planting was underway by mid-May but came to standstill in many counties due to low soil moisture at the end of May. Early peach harvest began the last week of May shortly after early harvest of some vegetable crops began in Coastal counties. Pastures and small grains were in fair to good condition at month's end.

JUNE: Temperatures during June were hotter than normal during most of the period. Rainfall averaged above normal over much of South Carolina. Statewide it was the wettest June since 1982, although some stations reported below normal amounts.

Soybean planting made good progress and was almost 90 percent complete by the end of the month, despite some replanting due to earlier dry conditions. The condition of the crop improved from fair to good during the month due to much needed rain. Corn developed rapidly during the month and was in good condition and tasseling at month's end. The cotton crop progressed well during the month and was in good condition as the month ended with three-forth's of the acreage squaring and a small percentage setting bolls. Tobacco improved during the month, but topping was about 30 percent below normal. The peanut and sorghum crops were in good condition by month's end.

Peach harvesting continued, with some interruptions due to showers. Cantaloup and watermelon harvest began during the last week of June with condition rates good.

Small grain harvest was slightly behind normal at month's end due to interruption from frequent showers and damp conditions. Pasture condition was good.

JULY: The month was hotter and drier than normal, although not nearly as severe as in 1986. Temperatures averaged 1 to 4 degrees above normal with the hottest temperatures of the year occurring during the third week of July. There was a three week period during mid-July without any rainfall in the Northwestern and Western areas of the State.

The general condition of all crops declined during July due to the hot, dry weather. Corn and tobacco were least effected by the weather as both were maturing through the month, with tobacco harvest in full swing by the end of July. Cotton started the month in good condition, but by month's end, was shedding fruit and rated in fair condition. Soybean planting was virtually completed by mid-July, with great potential, but was in only fair condition by the end of the month. Peanuts and sorghum were in dire need of rain.

Peach harvest continued; apples were in fair to good condition, with no harvesting started by the end of July. Cantaloup and watermelon harvest were about normal for the month. Light grape harvest began toward the end of the month.

Pastures deteriorated to fair condition by the end of the month. Summer hay crops were suffering from heat and dry weather stress.

AUGUST: August was one of the warmest on record with many stations reporting record or near record monthly temperatures. Existing high record marks were broken at Greer and Columbia. Dry conditions persisted in the West, with less than one inch of precipitation falling in some areas. Rainfall in the East was somewhat heavier with near or above normal amounts at many locations.

Corn harvest started during the first week of August and progressed well through the month with about one-third of the acreage out of the field by month's end. Tobacco harvest was about 85 percent complete by the end of August. Both cotton and soybean prospects dropped during the month as occasional showers did little to alleviate the need for good general rains. Some cotton bolls were cracking prematurely and soybeans were shedding pods. Light peanut harvesting was underway by the end of the month and sorghum was nearly 30 percent harvested.

Peach harvest was virtually complete by the end of August with apple picking gaining momentum. Grape harvest continued at a slow pace. Planting of fall vegetables was underway in areas with suitable soil moisture.

Pasture and hay crops were in mostly poor condition as August ended with moisture needed to maintain growth.

SEPTEMBER: Temperatures during September averaged near to slightly above normal statewide. The hottest weather occurred during mid-month, with occasional high temperatures in the low 90's. Rain occurred practically everyday during the first ten days of the month. Unfortunately, it fell in the Eastern portion of the State, leaving the Western portion drier than normal. There was little rain reported in the State after mid-month.

Corn harvest moved at a slow pace early in the month due to the wet weather. However with dry weather the last two weeks of the month the pace picked up and nearly 80 percent of the crop was harvested by month's end. Cotton harvest got off to a slow start but by the end of September was 13 percent complete, slightly ahead of normal. Tobacco harvest was virturally complete by mid-month. Soybean condition improved throughout the month due to the rains early in the month. Peanut harvest continued but lagged behind normal.

Apple harvest continued through this month with condition rated fair to good. Grape harvest lagged throughout the month and was 30 percent below normal at month's end. Sweetpotato harvest was also below normal.

Overall pasture condition improved from poor to fair to good by the end of September. Planting of winter grazing crops began toward the end of the month.

OCTOBER: October's weather was very dry and cold with temperatures averaging four to more than seven degrees below normal. In Central and Western South Carolina, it was the coldest October since records began in 1889. Rainfall varied from less than a tenth of an inch at some stations in the Western portion to over two inches in the Northeast. It was the driest month since 1963 or earlier in the Western section of the State.

Due to the dry weather throughout the month, corn harvest was nearly complete by mid-October, about the same time early soybean harvest was just getting underway. Cool temperatures and early frosts arrived before many late planted soybean fields were fully mature and some yield reduction occurred. Cotton harvest was very active during the month and was well over 80 percent complete by month's end. Peanut harvest made good progress and was 87 percent complete by October 30. Sorghum harvest was slightly ahead of normal.

Apple harvest made good progress through the month as did sweetpotato harvest which ended the month ahead of normal.

Pasture and hay crops were in fair condition. Germination and growth of fall seeded small grains was very slow with planting halted in many areas due to dry soils.

NOVEMBER: Temperatures varied greatly during the month with record low temperatures at many stations; however, the average for the month was one to four degrees above normal. Total precipitation for November was more than twice the normal amount at many locations in the Eastern half of the State. Portions of the Upstate had somewhat below normal precipitation.

Cotton harvest was nearly complete by mid-month, well ahead of normal and soybean harvest made excellent progress despite periods of rain during the month. By month's end, about 78 percent of the soybean crop had been harvested, 25 percent ahead of normal. Sorghum harvest was 90 percent complete by month's end.

Apple harvest was complete by mid-month. Sweetpotato harvest increased early in the month but slowed considerably the last two weeks of this month due to wet weather. Pecan condition was fair to good at month's end.

Pasture and small grain condition improved to fair to good. The rainfall aided germination and growth of small grains and allowed continued planting in some areas.

DECEMBER: Temperatures for the month averaged two to four degrees warmer than usual. The highest and lowest readings occurred during the last six days of the month with 78 degrees at Beaufort being the highest and 16 degrees at Cedar Creek being the lowest.

Soybean harvest was over 95 percent complete by mid-month and virtually finished by the end of December despite periods of rain. The last portion of the 1987 cotton crop was out of the fields by mid-December. Small grain planting continued. Fumigating and preparation of tobacco beds was begun.

SOUTH CAROLINA: Acreage, Yield, Production and Value of Crops, 1986 and 1987

1987 VEGETABLE ACREAGE HARVESTED UP 10 PERCENT

South Carolina's **acreage harvested** of all vegetable and small fruit commodities produced in 1987 was 45,620 acres, up 10 percent from the 41,460 acres harvested in 1986. Of the five leading commodities harvested, watermelon acreage was up 30 percent, fresh market snap beans acreage was up 19 percent and sweetpotato acreage was up 13 percent. Tomatoes and cucumbers for pickles showed declines of 10 and 1 percent respectively in acres harvested. Acreages harvested for other commodities were mixed with about the same number of crops showing increases as showed declines.

South Carolina's **value of production** of all vegetable and small fruit commodities was $53.5 million in 1987, 2 percent above the 1986 value of $52.7 million. The value of production for three of the five leading commodities showed increases with watermelons up 6 percent, sweetpotatoes up 15 percent and fresh market snap beans up 27 percent. Tomatoes and cucumbers for pickles showed declines in value of 10 and 14 percent respectively.

More detailed information on the 1987 Vegetable Survey will be published in the "South Carolina Vegetable Statistics"--AE449, May 1988.

ACREAGE, YIELD, PRODUCTION, PRICE AND VALUE OF COMMODITIES, 1987

1/Yield, production and average price in dozen bunches. 2/Includes: asparagus, beets, broccoli, cauliflower, cherry tomatoes, eggplant, honeydews, kale, mushrooms, pumpkins, spinach, sweet peas, turnips, and other miscellaneous and processing vegetables.

South Carolina Farm Numbers

The number of farms in SOUTH CAROLINA in 1987 is estimated at 26,000, down 1,000 or 4 percent from 1986. Total land in farms for 1987 is 5.2 million acres, down 200,000 acres or 4 percent from 1986. Average size of farm in 1987 is 200 acres, unchanged from 1986.

The number of farms in the UNITED STATES in 1987 is estimated at 2.17 million, down 2 percent from the 2.21 million in 1986. Total land in farms for 1987 is 1,003 million acres, down 0.5 percent from 1986. Average size of farm in the U.S. in 1987 is 461 acres, 5 acres larger than 1986 and 15 acres larger than 1985.

*1/Beginning in September 1986, the survey dates were changed to September 1 instead of October 1, December 1 instead of January 1, and March 1 instead of April 1. 2/Per program modification: On-farm corn, wheat and sorghum grain stocks estimates discontinued. Off-farm barley and oats will be made as of June 1 each year; sorghum stocks estimates each June 1 and September 1. 3/Prior to September 1, 1986 the fourth quarter reference date for soybeans was September 1 not October 1. *Unpublished to avoid disclosing individual operations.*

Distribution of Commercial Fertilizers in South Carolina by Grades, Materials and Primary Plant Nutrients (Tons), July 1, 1986 - June 30, 1987 1/
